

Claude Folder Setup

The .claude Folder Setup Guide

By **Manthan Patel** (@LeadGenMan)

I've been using Claude Code for over a year. This is the exact setup I use to turn Claude into a full dev team. Copy it. Customize it. Ship faster.

The Structure

```
.claude/
├── agents/      ← Your AI team members
├── commands/   ← Custom slash commands
├── hooks/      ← Rules Claude MUST follow
├── rules/      ← Context-aware instructions
├── skills/     ← Situational intelligence
└── settings.json ← The control center
CLAUDE.md      ← The project brain (root)
```

1. Agents

Each agent is a specialist. Claude delegates work to the right one automatically.

Location: `.claude/agents/code-reviewer.md`

YAML

```
---
name: code-reviewer
description: Reviews code for bugs and security issues before merge.
tools: Read, Glob, Grep, Bash
model: sonnet
memory: project
---
```

You are a senior code reviewer.

Step 1: Run ``git diff HEAD~1``, read every changed file.

Step 2: Security scan -- grep for hardcoded keys, check Zod validation, verify auth.

Step 3: Performance -- no unnecessary re-renders, images use next/image.

Step 4: Quality -- no ``any`` types, functions under 50 lines, no duplication.

Step 5: Report as CRITICAL / WARNING / SUGGESTION. Block if CRITICAL found.

I run 6 agents: code-reviewer, debugger, test-writer, refactorer, doc-writer, security-auditor.

Field	What it does
tools	Which tools the agent can access
model	sonnet, opus, or haiku
memory	Remembers context across sessions
maxTurns	Max steps before stopping

2. Commands

Set up the prompt once, run it anytime. No retyping.

Location: `.claude/commands/fix-issue.md`

```

---
name: fix-issue
argument-hint: [issue-number]
---

Fix GitHub issue #${ARGUMENTS}:
1. `gh issue view ${ARGUMENTS}` -- read the issue
2. Find relevant source files
3. Implement the minimal fix
4. Write a regression test
5. `npm test` -- all green
6. Commit: "fix: description (closes #${ARGUMENTS})"

```

Usage: Type `/fix-issue 42` and Claude handles the rest.

I use 3 commands: `/fix-issue`, `/deploy`, `/pr-review`.

3. Hooks

Rules that Claude **cannot** break. Scripts that run before/after every action.

Location: `.claude/hooks/pre-commit.sh`

```
#!/bin/bash
# Before EVERY commit: type check → lint → test
# If anything fails, commit is BLOCKED.

npx tsc --noEmit || exit 2
npx eslint $(git diff --cached --name-only | grep -E "\.(ts|tsx)$") --quiet || exit 2
npm test -- --silent || exit 2

echo "All checks passed!"
exit 0
```

Exit code 2 = block the action. Exit code 0 = allow it.

I use 2 hooks: `pre-commit.sh` (blocks bad commits), `lint-on-save.sh` (auto-formats after edits).

4. Rules

Separate instruction files. Claude only loads what's relevant to the file you're editing.

Location: `.claude/rules/frontend.md`

```
---
paths:
  - "components/**/*.tsx"
  - "app/**/*.tsx"
---

# Frontend Rules
- Functional components + hooks only
- shadcn/ui for primitives, never build from scratch
- Tailwind CSS, dark mode first
- Zustand for global state, no prop drilling
- cn() for conditional classes
- next/image for all images
```

I use 3 rule files: `frontend.md`, `database.md`, `api.md`. Claude auto-loads based on which files I'm touching.

5. Skills

Instruction sets Claude applies when it recognizes a specific situation. You can also invoke them manually.

Location: `.claude/skills/frontend-design/SKILL.md`

```
---
name: frontend-design
description: Apply my exact design standards to any UI
user-invocable: true
---
```

Colors: #FF6B35 primary, #0A0A0F background, rgba(255,255,255,0.04) surfaces
Typography: Inter, -0.02em tracking, 48-64px hero, 15-16px body
Spacing: 64px sections, 24px card padding, 16px border radius
Dark mode: Never flat black. Depth through gradients, glows, borders.

When I ask Claude to build a landing page, this skill kicks in automatically. My exact palette, spacing, everything.

6. CLAUDE.md

The brain. Loaded **every single session**. Put your stack, commands, and conventions here.

Location: `./CLAUDE.md` (project root)

```
# Project Brain

## Stack
Next.js 14, Tailwind + shadcn/ui, Supabase, Stripe, Vercel

## Commands
npm run dev | npm run build | npm test | npm run lint

## Conventions
- TypeScript strict, no `any`
- Zustand for state
- Dark mode first
- Auto-commit after every change
```

7. settings.json

Controls permissions, hooks, and model config.

Location: `.claude/settings.json`

```

{
  "permissions": {
    "allow": [
      "Bash(npm run lint)",
      "Bash(npm run test *)",
      "Bash(npm run build)",
      "Bash(git diff *)",
      "Bash(gh issue *)"
    ],
    "deny": [
      "Read(.env)",
      "Read(.env.*)",
      "Bash(rm -rf *)",
      "Bash(git push --force *)"
    ]
  },
  "hooks": {
    "PreToolUse": [{
      "matcher": "Bash",
      "hooks": [{ "type": "command", "command": ".claude/hooks/pre-commit.sh" }]
    },
    "PostToolUse": [{
      "matcher": "Edit|Write",
      "hooks": [{ "type": "command", "command": ".claude/hooks/lint-on-save.sh" }]
    }
  ],
  "model": "claude-sonnet-4-6",
  "autoMemoryEnabled": true
}

```

Quick Setup

```
mkdir -p .claude/{agents,commands,hooks,rules,skills/frontend-design}
touch .claude/agents/{code-reviewer,debugger,test-writer,refactorer,doc-writer,security-auditor}.md
touch .claude/commands/{fix-issue,deploy,pr-review}.md
touch .claude/hooks/{pre-commit,lint-on-save}.sh
touch .claude/rules/{frontend,database,api}.md
touch .claude/skills/frontend-design/SKILL.md
touch .claude/settings.json CLAUDE.md
chmod +x .claude/hooks/*.sh
```

Paste the content from each section above into the matching file. Done.
